

**ASSEMBLY WITH MOVABLE WORK SURFACE PORTION
AND MATERIAL HOLDER**

ABSTRACT

The present invention provides an assembly having a movable portion and a fixed portion. At least a portion of the movable portion comprises a work surface. The assembly further includes a storage device having a material holder that moves from a first position in a substantially covered configuration to a second position that uncovers or exposes at least a portion of the material holder so that a user can access the material holder and contents therein. A connection component connects the material holder to the movable portion and moves the material holder from the covered configuration to the uncovered, at least partially accessible, configuration by utilizing a translation of force from the movement of the movable portion.
